Dive Profile

The diagrams illustrate three different dive profiles:

- NDL (No Decompression Limit):** Shows a single dive profile with a safety stop. The profile starts at a depth, descends, and then ascends. The ascent is marked with a 'min' (minimum) time, indicating the required ascent rate.
- RBT (Repetitive Breathing Table):** Shows a repetitive dive profile. The first dive is followed by a safety stop. The second dive is shorter, and the ascent is marked with a 'min' (minimum) time. The profile includes a 'RNT +ABT' (Repetitive No Time + Ascent Breathing Table) box, indicating the required ascent rate for the second dive.
- Third Profile:** Shows a dive profile with a safety stop and a final ascent. The ascent is marked with a 'min' (minimum) time. The profile includes a 'RNT +ABT' (Repetitive No Time + Ascent Breathing Table) box, indicating the required ascent rate for the final ascent.

Dive Profile

The diagram illustrates four different dive profiles, each plotted on a graph of Depth (Y-axis) versus Time (X-axis). The profiles are labeled as follows:

- NDL:** No Decompression Limit. The profile shows a single descent and ascent without a safety stop. The label "FG" (First Gas) is positioned above the ascent phase.
- RBT:** Recreational Bubble Threshold. The profile includes a safety stop (labeled "Safety Stop") before ascending. The label "FG" is above the ascent phase.
- RNT:** Recreational Nitrogen Threshold. The profile includes a safety stop and a second gas switch (labeled "SI" for Second Gas) during the ascent. The label "FG" is above the ascent phase.
- RBT:** Recreational Bubble Threshold. The profile includes a safety stop and a second gas switch during the ascent. The label "FG" is above the ascent phase.

Below each profile, a box indicates the time components: "BOTTOM TIME" for NDL, and "RNT +ABT +TBT" for the other three profiles. The "ABT" (Ascent Bottom Time) is the time spent at the safety stop, and "TBT" (Total Bottom Time) is the total time at the bottom.

Dive Profile

The diagram illustrates three different decompression strategies for a dive profile, each showing depth on the y-axis and time on the x-axis.

- NDLE (No Decompression Limit):** The profile shows a descent to a depth, a bottom time, and an ascent. The ascent is labeled with "FG" (Free Gas) and "FG" (Free Gas) at the surface. The bottom time is labeled "BOTTOM TIME".
- RNT (Residual Nitrogen Time):** The profile shows a descent to a depth, a bottom time, and an ascent. The ascent is labeled with "FG" (Free Gas), "FG" (Free Gas), and "FG" (Free Gas) at the surface. The bottom time is labeled "BOTTOM TIME". Below the profile, a box indicates the calculation for RNT: $RNT = +ABT - TBT$.
- RBT (Residual Bottom Time):** The profile shows a descent to a depth, a bottom time, and an ascent. The ascent is labeled with "FG" (Free Gas), "FG" (Free Gas), and "FG" (Free Gas) at the surface. The bottom time is labeled "BOTTOM TIME". Below the profile, a box indicates the calculation for RBT: $RNT = +ABT - TBT$.

Notes and observations of surface conditions on day of the dive:
Notes from dive:
Notes from dive debrief:

The diagram illustrates the difference between a No-Decompression Limit (NDL) and a Required Bottom Time (RBT) for a dive profile. It shows two scenarios for a 10m dive with a 5m safety stop.

NDL (No-Decompression Limit): The profile shows a 10m descent, a 5m safety stop, and a 10m ascent. The NDL is indicated by a horizontal line at the 5m depth level.

RBT (Required Bottom Time): The profile shows a 10m descent, a 5m safety stop, and a 10m ascent. The RBT is indicated by a horizontal line at the 5m depth level, with a box labeled "RNT +ABT" indicating the required bottom time.

Dive Profile

The diagram illustrates four different dive profiles, each showing depth on the vertical axis and time on the horizontal axis. The profiles are labeled as follows:

- NDL:** A simple profile with a descent, a horizontal segment at the bottom, and an ascent. A 'Safety Stop' is indicated on the ascent. The horizontal axis is labeled 'BOTTOM TIME'.
- RBT:** A profile with a descent, a horizontal segment at the bottom, and an ascent. A 'Safety Stop' is indicated on the ascent. The horizontal axis is labeled 'BOTTOM TIME'.
- RNT:** A profile with a descent, a horizontal segment at the bottom, and an ascent. A 'Safety Stop' is indicated on the ascent. The horizontal axis is labeled 'BOTTOM TIME'.
- RBT:** A profile with a descent, a horizontal segment at the bottom, and an ascent. A 'Safety Stop' is indicated on the ascent. The horizontal axis is labeled 'BOTTOM TIME'.

Each profile includes a 'Safety Stop' and a 'BOTTOM TIME' label. The RNT and RBT profiles also include a 'RNT +ABT' box.

Dive Profile

The diagram illustrates four different dive profiles, each plotted on a graph of Depth (Y-axis) versus Time (X-axis). The profiles are labeled as follows:

- NDL:** No Decompression Limit. Shows a single descent and ascent without a safety stop.
- RBT:** Recreational Bubble Threshold. Shows a descent, a safety stop (marked 'Safety Stop'), and an ascent.
- RNT:** Recreational No Time Limit. Shows a descent, a safety stop (marked 'Safety Stop'), and an ascent.
- RBT:** Recreational Bubble Threshold. Shows a descent, a safety stop (marked 'Safety Stop'), and an ascent.

Each profile is associated with a specific time interval, indicated by a horizontal line segment labeled 'BOTTOM TIME'.

Below the profiles, there are four boxes representing the time intervals for each profile:

- NDL:** A box labeled 'RNT' with '+ABT' and 'TBT' below it.
- RBT:** A box labeled 'RNT' with '+ABT' and 'TBT' below it.
- RNT:** A box labeled 'RNT' with '+ABT' and 'TBT' below it.
- RBT:** A box labeled 'RNT' with '+ABT' and 'TBT' below it.

Notes and observations of surface conditions on day of the dive:
Notes from dive:
Notes from dive debrief:

The diagram shows two dive profiles on a depth-time axis. The first profile, labeled 'NDL', shows a descent, a bottom time, and an ascent with a 'Safety Stop' and 'min' time. The second profile, labeled 'RBT', shows a similar descent and bottom time, but the ascent is longer, with a 'min' time and a 'Safety Stop' box. The box contains 'RNT', '+ABT', and 'TBT'.

Dive Profile

The diagram illustrates four different dive profiles, each plotted on a graph of Depth (Y-axis) versus Time (X-axis). The profiles are labeled as follows:

- NDL:** No Decompression Limit. The profile shows a single descent and ascent without a safety stop. The label "FG" (First Gas) is shown above the ascent phase.
- RBT:** Recreational Bubble Threshold. The profile includes a safety stop (labeled "Safety Stop") before ascending. The label "FG" is shown above the ascent phase.
- RNT:** Recreational No-Tissue. The profile includes a safety stop before ascending. The label "FG" is shown above the ascent phase.
- RBT:** Recreational Bubble Threshold. The profile includes a safety stop before ascending. The label "FG" is shown above the ascent phase.

Each profile is labeled with "DEPTH" on the Y-axis and "BOTTOM TIME" on the X-axis. The profiles are color-coded: NDL is blue, RBT is green, RNT is red, and RBT is yellow.

Dive Profile

The diagram illustrates the difference between a No-Decompression Limit (NDL) and a Required Bottom Time (RBT) for a dive profile. It shows two profiles: one for NDL and one for RBT.

NDL Profile: The profile starts at the surface, descends to 10m, and then ascends back to the surface. A 'Safety Stop' is indicated at 5m. The 'BOTTOM TIME' is marked as the time from the start of the descent to the end of the ascent.

RBT Profile: The profile starts at the surface, descends to 10m, and then ascends back to the surface. A 'Safety Stop' is indicated at 5m. A 'Safety Stop' is also indicated at 10m. The 'RNT +ABT +TBT' box indicates the required bottom time. The 'BOTTOM TIME' is marked as the time from the start of the descent to the end of the ascent.

Notes and observations of surface conditions on day of the dive:
Notes from dive:
Notes from dive debrief:

The diagram shows two dive profiles on a depth-time axis. The first profile, labeled 'NDL', shows a descent, a bottom time, and an ascent with a 'Safety Stop' and 'min' time. The second profile, labeled 'RBT', shows a similar descent and bottom time, but the ascent is longer, with a 'min' time and a 'Safety Stop' box. The box contains 'RNT', '+ABT', and 'TBT'.

Dive Profile

The diagram illustrates four different dive profiles on a Depth vs. Time axis:

- NDL:** A simple descent and ascent profile with no safety stop.
- RBT:** A profile with a safety stop (marked 'min') before ascent. The ascent phase is labeled 'RNT'.
- RNT:** A profile with a safety stop (marked 'min') before ascent. The ascent phase is labeled 'RNT + ABT'.
- RNT + ABT:** A profile with a safety stop (marked 'min') before ascent. The ascent phase is labeled 'RNT + ABT + TBT'.

Labels above the profiles indicate phases: FG (Free Gas), SI (Safety Interval), and FG (Free Gas). The 'Safety Stop' is indicated by a horizontal line segment at a shallow depth.

Dive Profile

The diagram illustrates four different dive profiles, each showing depth on the vertical axis and time on the horizontal axis. The profiles are labeled as follows:

- NDL:** No Decompression Limit. The profile shows a descent to a depth, a bottom time, and an ascent. A 'Safety Stop' is indicated during the ascent.
- RBT:** Recreational Bubble Threshold. The profile shows a descent to a depth, a bottom time, and an ascent. A 'Safety Stop' is indicated during the ascent.
- RNT:** Recreational No Time Limit. The profile shows a descent to a depth, a bottom time, and an ascent. A 'Safety Stop' is indicated during the ascent.
- RNT+ABT:** Recreational No Time Limit with Ascent Bubble Threshold. The profile shows a descent to a depth, a bottom time, and an ascent. A 'Safety Stop' is indicated during the ascent.

Each profile includes a 'Safety Stop' and a 'Bottom Time' measurement. The RNT and RNT+ABT profiles include a 'RNT' box with sub-timers for '+ABT' and 'TBT'.

Notes from dive debrief:

The diagram illustrates the Dive Profile for a Nitrox (RNT) dive. It shows a depth profile with a descent to a safety stop depth, followed by a bottom time (RNT) period, and then an ascent. The profile is divided into three segments: PG (Pre-Gas), SG (Safety Gas), and PG (Post-Gas). The first segment (PG) is labeled 'PG' and 'PG'. The second segment (SG) is labeled 'SG' and 'SG'. The third segment (PG) is labeled 'PG'. The profile is labeled 'Dive Profile' and 'RNT'.

Dive Profile

The diagram illustrates four different dive profiles, each plotted on a graph of Depth (Y-axis) versus Time (X-axis). The profiles are labeled as follows:

- NDL:** No Decompression Limit. The profile shows a single descent and ascent without a safety stop. The label "FG" (First Gas) is present above the ascent phase.
- RBT:** Recreational Bubble Threshold. The profile includes a safety stop (labeled "Safety Stop") before ascending. The label "FG" is present above the ascent phase.
- RNT:** Recreational Nitrogen Threshold. The profile includes a safety stop (labeled "Safety Stop") before ascending. The label "FG" is present above the ascent phase.
- RBT:** Recreational Bubble Threshold. The profile includes a safety stop (labeled "Safety Stop") before ascending. The label "FG" is present above the ascent phase.

Each profile shows a descent phase, a bottom time phase, and an ascent phase. The "Safety Stop" is indicated by a horizontal segment at a shallow depth before the final ascent. The "FG" label indicates the point where the first gas is eliminated from the body.
